

The **Scalable** Platform for Urban Greening

We built an universal platform for every city around the world to find spots for planting trees.

Complete Universality

City Agnostic. Our architecture isn't hardcoded for one location. It adapts to any location instantly.

True Flexibility

Feature Extendability. We don't just use accessible datasets. We provide you with a reusable tool backed by up-to-date data.

Adaptive UX

Intuitive Interface. Zero training required for city planners to start planting.

Global Heat, Universal Tool

THE PROBLEM

Urban heat is universal.

The challenge isn't just planting; it's building a tool only once that works anywhere. How do we ensure scalability across diverse cities?

OUR APPROACH

Build Once, Run Anywhere.

Initially piloted on Heilbronn's data, we transformed our approach into a universal model based on OpenStreetMap. It operates independently of specific local data availability.

Bridging Public & Private Data

THE PROBLEM

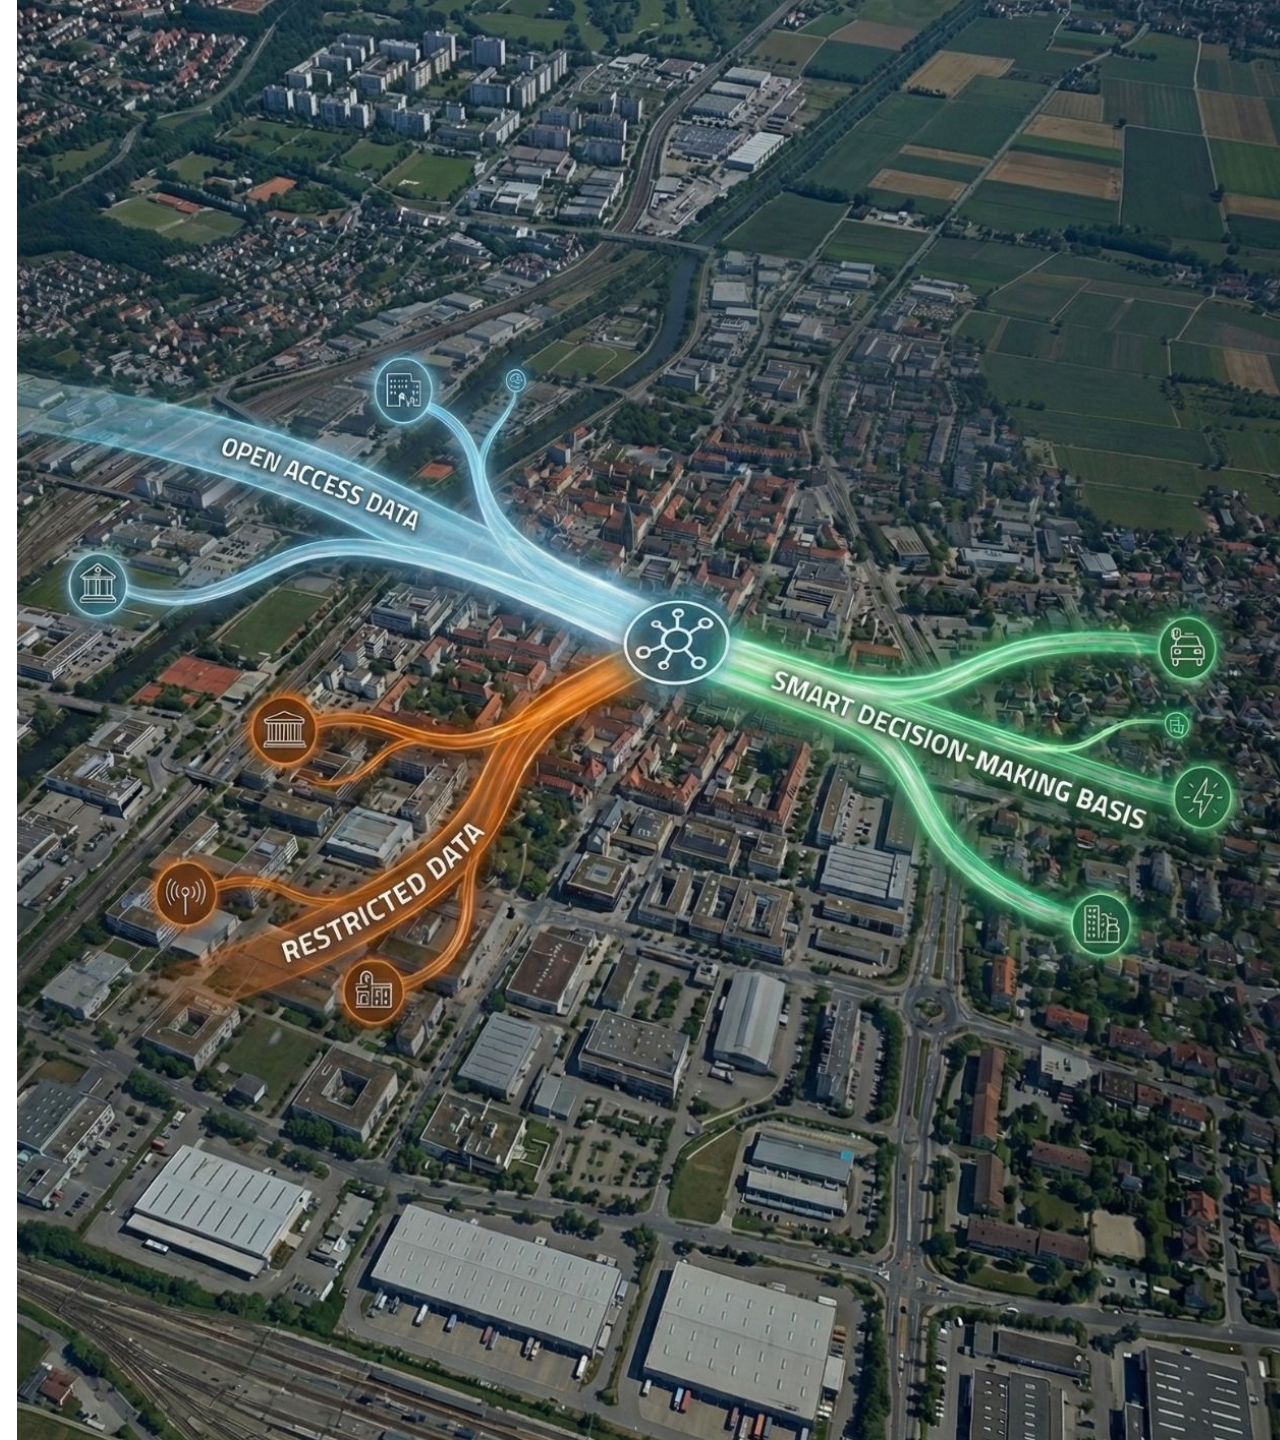

Public data isn't enough.

Effective decision-making relies on restricted, high-value local data that isn't public. How do we optimize for local needs without breaking the universal model?

OUR APPROACH

Scalable Extensibility.

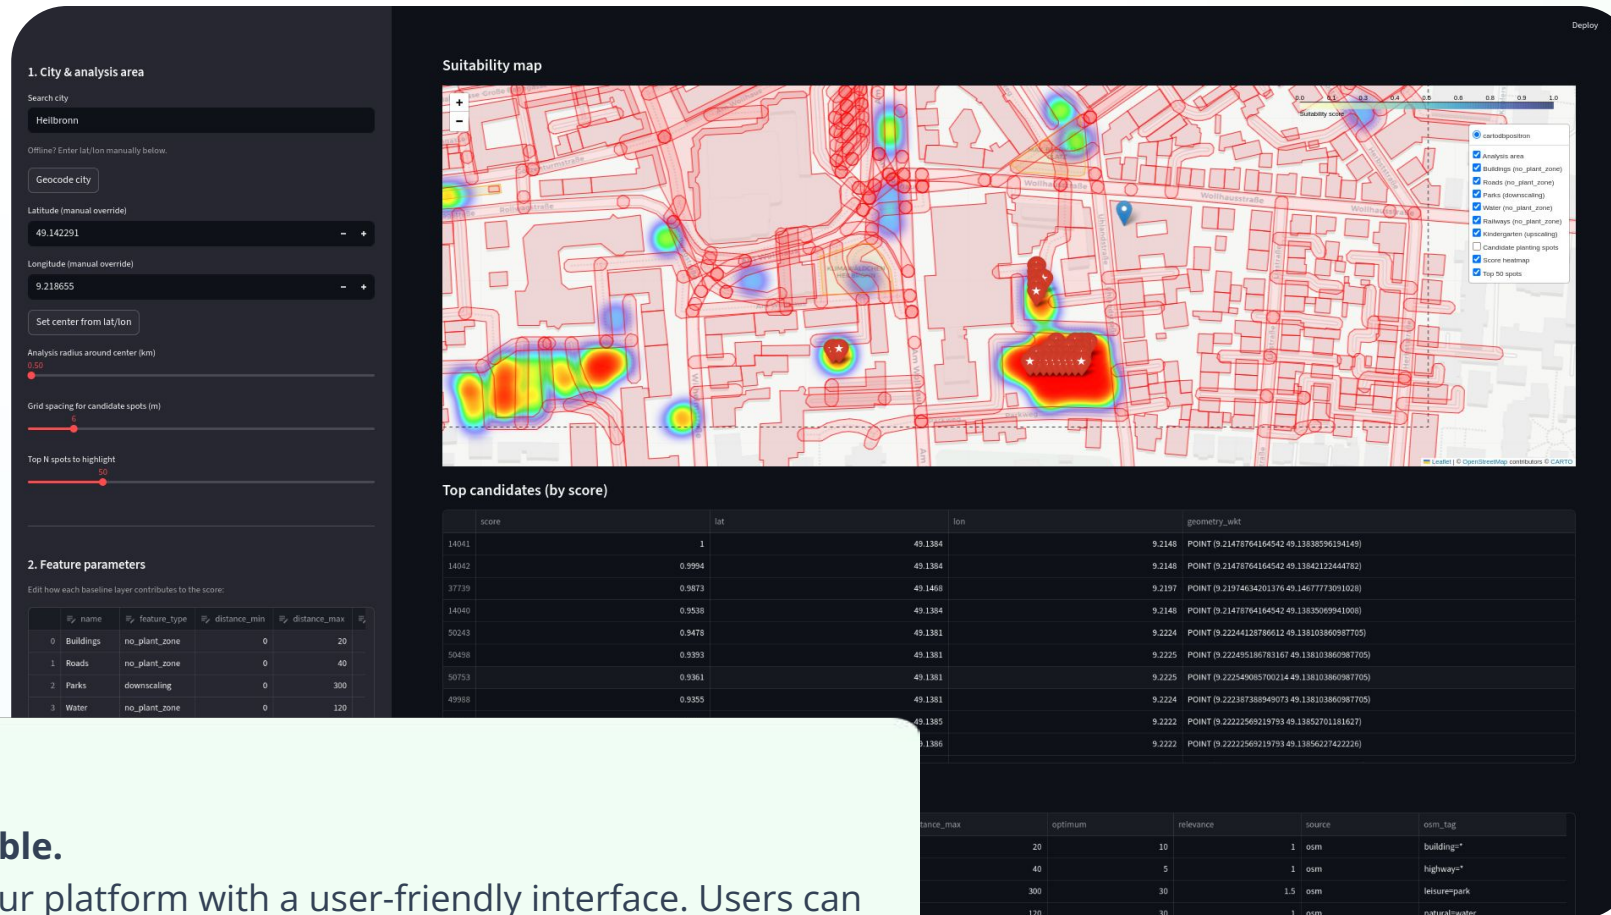

Our model accepts manually uploaded spatial or geographic data (e.g., CSV, Shapefiles). This private data is weighed alongside public layers to refine the output locally.

Democratizing Data Analysis

THE PROBLEM

"I don't have technical knowledge.
Complex formats, variables, and data create a barrier."

OUR APPROACH

Intuitive & Adaptable.

We strengthened our platform with a user-friendly interface. Users can easily upload data and adjust relevance factors via simple sliders to match their specific goals.

1. City & analysis area

Search city

Hamburg

Offline? Enter lat/lon manually below.

Geocode city

Latitude (manual override)

53.550341

Longitude (manual override)

10.000654

Set center from lat/lon

Analysis radius around center (km)

Grid spacing for candidate spots (m)

Top N spots to highlight

2. Feature parameters

Edit how each baseline layer contributes to the score:

	≡ name	≡ feature_type	≡ distance_min	≡ distance_max	≡ optim
0	Buildings	no_plant_zone	0	20	
1	Roads	downscaling	0	40	
2	Parks	upscaling	0	300	

Urban Tree Planting Explorer 🌳

Choose a city, adjust the heuristic, and explore suitable street tree planting spots.

1. Pick city & analysis center

Search the city in the sidebar, then click on the map to refine the center.

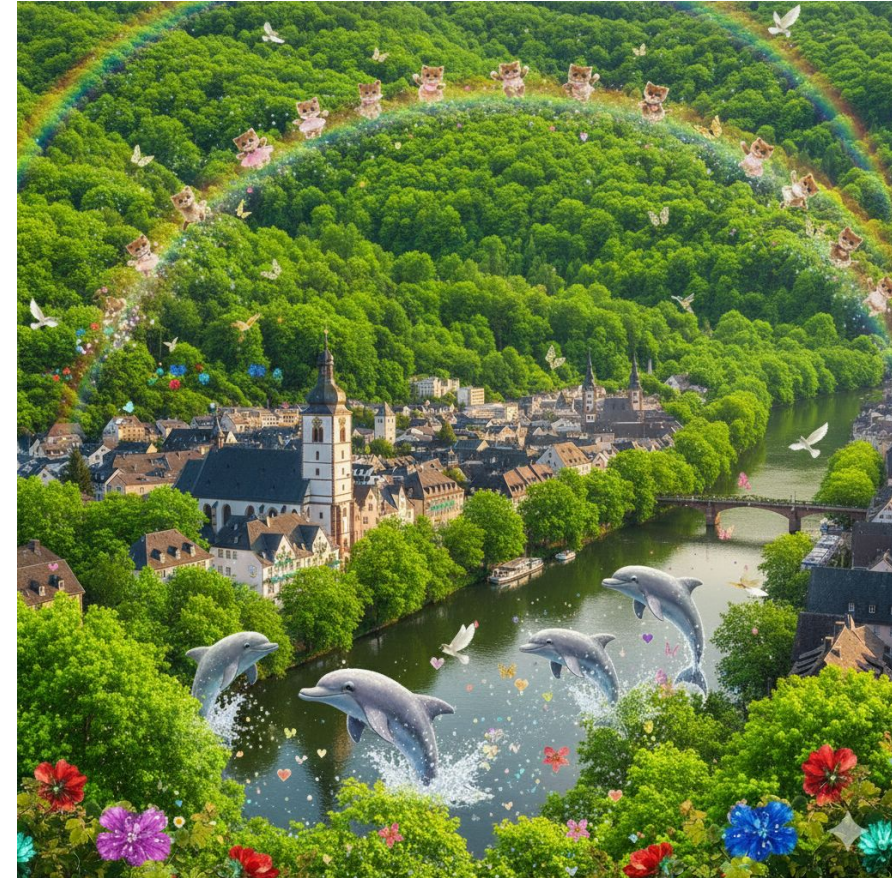

2. Run heuristic and inspect the heatmap

Run analysis / recompute heatmap

Suitability map

Let's make Heilbronn cooler again
